

Hello,

It sounds like your current needs for EDA workflow/tool integration might align well with my past and present experiences.

I'm a hands-on polyglot software architect, most recently for the wildly successful Ansible OSS project at Red Hat. I thrive in a fast-moving startup environment and have successfully navigated several exits and acquisitions. I've spent plenty of time in the EDA landscape in former lives- a few summers of circuit design at Intel (owned a few FUBs on Deschutes/Katmai/Coppermine), a CAD-focused startup that integrated with numerous vendors' tools, and even some informal design consulting on EDA tool wrapper architecture for boutique ASIC firms. I also have some previous experience with the RISC-V platform doing some emulation and debugging as a maintainer for the Python CFFI project.

I've been seeing mentions of AheadComputing for awhile- it's exciting to see signs of life in my own backyard here in Beaverton, and I'm wondering if it's time to move on after ten years at my current startup-turned-giant-company gig.

Resume is attached- happy to discuss if anyone's interested!

-Matt Davis
